

CREST Concussion REcovery Study

Have you recently experienced a concussion injury?

A Research Team from Curtin University & the Perron Institute are investigating which factors may help us to identify people at risk of delayed recovery following concussion.

We are seeking participants between the ages of 18-65 years who have sustained a concussion injury from any cause (eg. falls, transport accidents, sport-related concussions, assault) and have been diagnosed by a medical doctor. Participants must be recruited within 7 days of their concussion injury.

The project involves two parts:

Phase I: Telephone Interview regarding your concussion

Phase II (eligible subset): further testing including MRI, blood test, exercise bike test & neuropsychological tests

For more information on the study and to discuss participation, please contact the Research Team on
